Figure $\mathrm{S}_{4} \mathrm{NO}_{3}$ and $\mathrm{N}_{2} \mathrm{O}_{5}$ profiles from chamber experiment cyclopentane reacting with $\mathrm{NO}_{3}$ radicals (The blue bar indicates the time at which cyclopentane was injected into the chamber and the time it took for complete mixing.). Two separate reaction periods are noted in the figure. Fitting the observed profile within these two periods yielded the same value for the rate coefficient.

* This is the quoted levels of total hydrocarbon impurities in the sample from the vendor supplied.

We assumed that the hydrocarbons could be olefins in assessing some of our measured rate coefficients.
** The impurities in these samples are quantified using a GC-MS, the detection limit of the GC-MS for olefins in alkanes is 20 ppmv .
