HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

We analyzed the participation of women scientists in 10 ESA (European Space Agency) Solar System missions over a period of 38 years [1]. Being part of a spacecraft mission science team can be considered a proxy to measure the "success" in the field. Although the number of female scientists in the field has been constantly increasing in Europe, we did not observe a similar increase in their participation in ESA Solar System missions. Participation of women in PI (Principal Investigators) teams varied between 4 and 25%, with several missions with no women as PI. The percentage of female scientists as Co-I (Co-Investigators) is always less than 16%. This number is lower than the percentage of women in the International Astronomical Union from all ESA Member States (24%).

We compared our results with NASA statistics. Participation of women in NASA spacecraft science teams varies from none to just over 30% [2]. The percentage has been increasing. However, this increase is more similar to a step function than a linear increase, with the pre-2000 average at 5.7% and post-2000 at 15.8%. This is well below the percentage of women in the field in the US, which has grown from 20% to 30% over the same time range. The ESA data are consistent with the NASA data, including the jump around the year 2000.

One of the main difficulties we encountered was to find the list of team members. An additional difficulty was to determine the percentage of female scientists in planetary science in Europe. We would like to encourage the planetary community as a whole, as well as international organizations, universities and societies to continuously gather statistics over many years. Detailed statistics are only the first step to closely monitor the development of achievement gaps and initiate measures to tackle potential causes of inequity, leading to gender inequalities in STEM careers.
